

Investigating Speed Patterns and Estimating Speed on Traffic-Calmed Streets

Basil Daniel, Alan Nicholson and Glen Koorey
University of Canterbury, Christchurch

Introduction

Safer Residential Streets

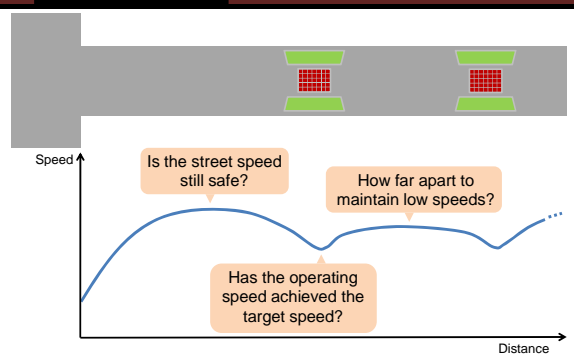

- Speeding on local streets is a major concern.
- Create safer streets to protect road users and improve community livability.
- Employ speed reduction techniques – traffic calming.

Traffic-calmed streets = Lower speeds?

- Previous research agree.
- Are lower speeds maintained throughout the entire length of a street?
- Are the speeds simply lower across and in proximity with a traffic calming device?

2

Introduction

3

Introduction

Research Objectives

- To determine the speed-reducing effect and the extent of influence zones of vertical and horizontal deflections.
- To examine the effect of traffic calming devices on speed variation.
- To develop methods for the prediction of speed on traffic-calmed streets.

Research Area

17 residential streets in Christchurch, calmed by speed humps, speed tables, angled slow points and mid-block narrowings.

4

Method

Analysis of Speed Profiles

Speed profiles were plotted to compare speed-reducing effect and to determine influence zone of the different devices.

85th Percentile Speed

Street Speed

Operating Speed

Speed Difference

Influence Zone

Distance

5

Method

Testing for Variation In Speed

The F-test for equality of variances of speeds at the device and at distances from the device were conducted.

Speed Estimation Methods

- Speed-distance curves were produced to estimate speed at varying distances from the devices.
- Models for estimating speed midway between speed humps and speed tables were developed using linear regression.

6

- Mid-block narrowing

7

Results

Speed-Reducing Effect

Comparison of speeds on streets with isolated calming devices

Calming Device	Operating Speed (km/h)	Street speed (km/h)	Speed difference (km/h)
Speed Hump	21.0	43.0	21.1
Speed Table	35.0	46.1	11.1
Angled Slow Point (Flush)	39.6	54.5	15.0
Angled Slow Point (Raised)	30.0	49.9	19.9
Mid-block Narrowing (One-lane, Flush)	50.0	53.4	2.6
Mid-block Narrowing (One-lane, Raised)	44.7	48.7	3.5
Mid-block Narrowing (Two-lane, Flush)	50.8	52.1	1.1

8

Results

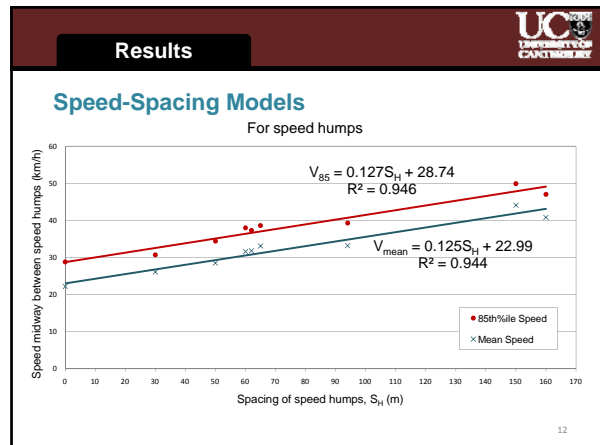

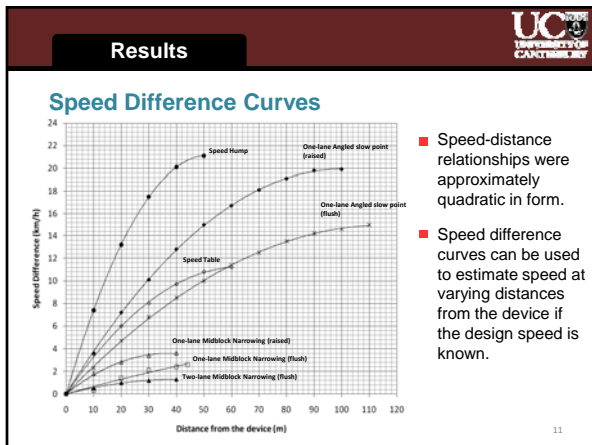

Variation of Speed at Devices

Large deviations from the mean speed when traversing calming devices imply that there is significant behavioural differences among drivers.

Variances in speed were:

- **smaller** across the **speed hump** and the **raised angled slow point** than other sections on the respective streets.
- **larger** across the **speed table** than other sections of the street.
- **similar** throughout streets with the **flush angled slow point** and **mid-block narrowings**.

Conclusions

Are vertical deflections effective?

- The **speed hump** produced the lowest operating speed (21.9 km/h) and largest speed change (-21.1 km/h). Variation of speeds across the speed hump was lower compared to other sections on the street.
- The **speed table** does reduce speed (-11.1 km/h), but operating speed is 15 km/h above the target speed of 20 km/h.

Are horizontal deflections effective?

- **Mid-block narrowings** do not reduce speed significantly.
- **Angled slow points** have a greater speed-reducing effect than mid-block narrowings and the speed table, but street and operating speeds are high.

Conclusions

Appropriate spacing for desired speed

- 85th percentile speed exceeds 50 km/h if spacing of:
 - speed humps is > 170 m
 - speed tables is > 145 m
- The spacing of speed humps is recommended to be ≤ 85 m to achieve a desired maximum 85th percentile of 40 km/h.
- A desired maximum 85th percentile speed of 40 km/h may not be attainable with speed tables, but 45 km/h is possible if spacing of speed tables is ≤ 70 m.

Closing

Achieving Low Speed Environments

- For traffic calming measures to be effective,
 - select devices that produce optimal speed-reducing effect.
 - use multiple devices that are appropriately spaced.
- There is a better chance of achieving low speed environments if a 30 km/h or 40 km/h speed limits is imposed and supported by traffic calming measures.
